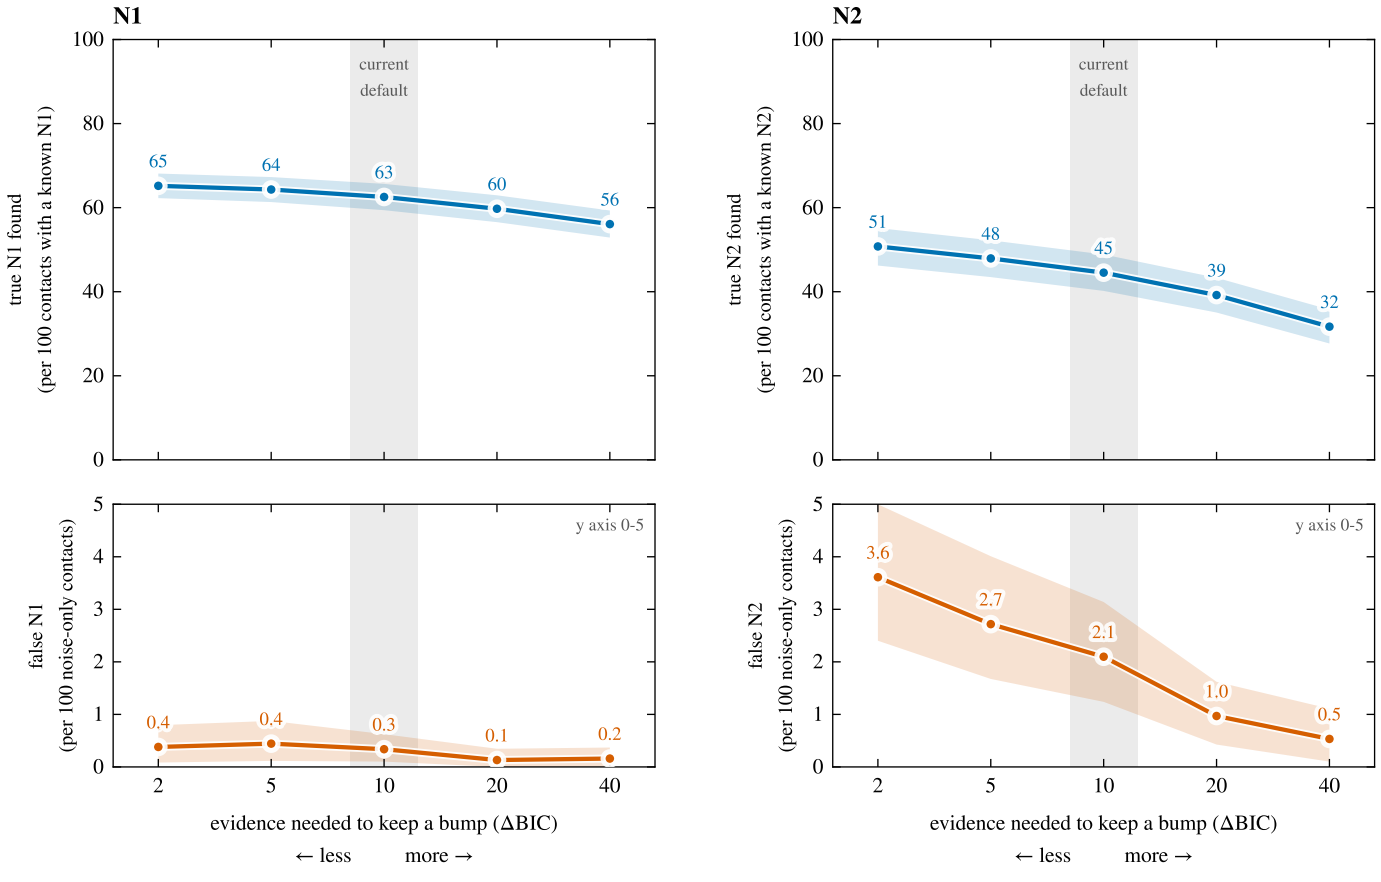
ΔBIC 10 → 40: true N2 found 45 → 32 %, false N2 2.1 → 0.5 %, true N1 found 63 → 56 % (51 patients)



N1, N2: early (9-50 ms) and late (50-300 ms) negative peaks of the evoked response. Bump: a peak the fitted model keeps. ΔBIC: drop of the Bayesian information criterion needed to keep a new bump. Known N1/N2 were added to real noise on half of the contacts; the other half are noise only. Line: mean of 51 patients. Band: 95 % confidence interval over patients.
