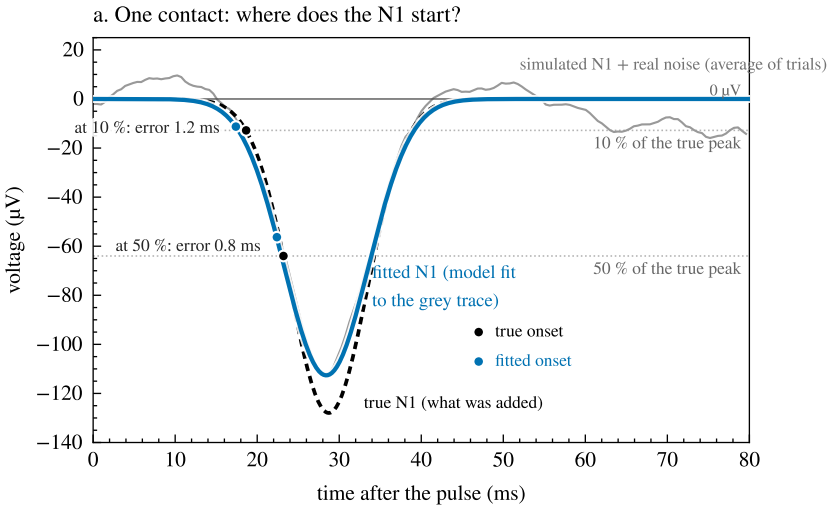
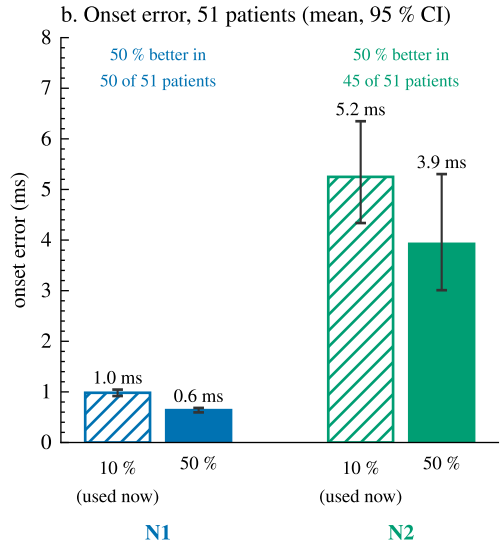
The onset is closer to the truth when read at 50 % of the peak than at 10 %





N1, N2: early (9-50 ms) and late (50-300 ms) negative peaks after the pulse. Onset: first time the curve reaches the given % of its own peak.

Error: |fitted onset - true onset| in ms. b: simulated N1 and N2 added to real recorded noise; median over contacts per patient, then mean of 51 patients; bars: 95 % confidence interval.
