Rule as written in the paper (van Blooijs et al. 2023)

- Noise: SD of the average between −1 and −0.1 s = 17 µV. Reference level = MEAN of that period.
- Trough: the lowest point between 9 and 100 ms that is lower than both of its neighbours (any depth counts; ○ = candidate troughs).
- Decision: N1 if the trough is deeper than k × SD below the level: 3.4 × 17 = 59 µV.
- Here: trough 128 µV deep > 59 µV → N1 YES.
